Quantity is zero (1 dash)

## I. --INTRODUCTION

The tables in this report were prepared from data supplied by the Veterans Administration, Department of Medicine and Surgery. These data represent a systematic random sample of all psychiatric patients resident in the Veterans Administration hospitals as of midnight, October 31, 1960. The sampling ratio (or percentage) was 20, 30, 40, 50, or 60 percent depending upon the type and size of hospital.

This report provides basic data on the numbers and characteristics of hospitalized mental patients in Veterans Administration hospitals. Any study of mental hospital resident patient data can be seriously biased by the omission of data on patients admitted to these facilities. This is particularly true in studies of changes in sex-specific resident patient rates over the years. For example, in 1960 there were 58,816 male veterans with psychiatric disorders in Veterans Administration hospitals as compared to 262,146* males in state and county mental hospitals. Among all the male patients with schizophrenic reactions hospitalized in the state and county mental hospitals and in the Veterans Administration hospitals combined at the end of 1960, 26.9* percent were in the Veterans Administration hospitals. Approximately 32.1* percent of the males in the age groups 25-44 and 55-64 were in Veterans Administration hospitals. Thus, interstate comparisons of data on hospitalized mental patients provide a biased picture unless data on the Veterans Administration hospitals are included.

## II. --COVERAGE

This report includes data on patients hospitalized at midnight October 31, 1960 in Veterans Administration hospitals located in the United States only. This includes neuropsychiatric hospitals and the psychiatric facilities of the general medical and surgical hospitals. All data are based on veterans who are residents of the United States (Alaska and Hawaii are included).

A systematic random sample was used to represent the characteristics of the entire patient population. The sampling ratio (or percentage) was 20, 30, 40, 50, or 60 percent depending upon the type and size of hospital. The data presented in this publication have been multiplied by an appropriate factor to represent 100 percent. Since some of these factors were not whole numbers, rounding differences were introduced. The data were partially adjusted to take these differences into account. Thus, the totals and subtotals will not necessarily be consistent between tables.

* Because of under-reporting the number of hospitalized males in the state and local government mental hospital has been estimated where possible.

TABLE 1

MALE RESIDENT PATIENTS AT END OF YEAR, BY AGE AND MENTAL DISORDER: UNITED STATES, 1960 [1]

(Based on a variable percentage sample [2])

| MENTAL DISORDER | TOTAL | AGE (IN YEARS) | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | Under 25 | 25-34 | 35-44 | 45-54 | 55-64 | 65-74 | 75-84 | 85 and over |
| ACUTE BRAIN SYNDROMES ASSOCIATED WITH: | | | | | | | | | |
| ALCOHOL INTOXICATION | 322 | - | 44 | 124 | 106 | 32 | 16 | - | - |
| DRUG OR POISON INTOXICATION (EXCEPT ALCOHOL) | 33 | 5 | - | 13 | 3 | 7 | 5 | - | - |

1 Because of differences due to rounding, the tables have been adjusted to be consistent internally. However, the marginal totals will not necesearily be coneistent between tablee (eee text).

2 Figures ehown are estimates based on tabulations from a systematic random sample of records for patients remaining on October 31, 1960. The eampling ratio (or percentage) wae 20, 30, 40, 50 or 60 percent, depending on the type and size of hospital.

1 Because of differences due to rounding, the tables have been adjusted to be consistent internally. However, the marginal totals will not neceesarily be consistent between tables (see text).

2 Figures shown are estimates based on tabulations from a systematic sample of records for patients remaining on October 31, 1960. The sampling ratio (or percentage) was 20, 30, 40, 50 or 60 percent, depending upon the type and size of hospital.

1 Because of differences due to rounding, the tables have been adjusted to be consistent internally. However, the marginal totals will not necessarily be consistent between tables (see text).

2 Figures shown are estimates based on tabulations from a systematic sample of records for patients remaining on October 31, 1960. The sampling ratio (or percentage) was 20, 30, 40, 50 or 60 percent, depending upon the type and size of hospital.

TABLE 6

1 Because of differences due to rounding, the tables have been adjusted to be consistent internally. However, the marginal totals will not necessarily be consistent between tables (see text).

2 Figures shown are estimates based on tabulations from a systematic sample of records for patients remaining on October 31, 1960. The sampling ratio (or percentage) was 20, 30, 40, 50 or 60 percent, depending upon the type and size of hospital.
